Team Operating System (TOS) — SRS v0.5 (Consolidated Baseline)

Owner: H M Forhad, Head of Product & Solution | **Status:** Baseline for Phase 0 (UI prototype) | **Supersedes:** v0.1 to v0.4 | **Audience:** AI coding agents and human reviewers

What this is. One self-contained specification. It merges the v0.3 core, the v0.4 playbook additions and the owner's review notes. Anything not written here is backlog (Section 12). *TOS is a working name; product name, logo and branding are tenant settings (FR-C1).*

0. How an AI builder should use this document

- Requirement IDs (FR-x, NFR-x) are stable. Reference them in code comments, tests and commits.
- Priority tags: **[MVP]** build first, **[P2]** next, **[P3]** later. Build only [MVP] until told otherwise; put everything else behind feature flags.
- **No company-specific content in code, defaults or UI.** The product ships with no default company, logo, team, role, activity, score or framework. Organisation name, logo, colours, currency, locale, time zone, week start, teams, roles, activities, points, weights, targets, frameworks and approval rules are all data created at setup. The first real team (a B2B software sales team) is loaded from an optional **Seed Pack** (Section 12.1), never hardcoded.
- Where this document says *Open Question (OQ)*, do not guess: use the stated default and make it configurable.
- Delivery order: (1) clickable enterprise UI on mock data, (2) lightweight working system, (3) integrations and scale, (4) full CRM only if management approves.
- Scoring and approval rules are the highest-risk logic: implement them as pure, unit-tested modules.

0.1 Decision log (owner decisions, binding)

#	Decision
D1	**Unplanned hours count provisionally;** the supervisor can review, edit, delete or flag any entry as unapproved later. Strict "zero until approved" is a team setting. A planned slot logged with a different activity is a **pending deviation** and counts

zero until approved. Supervisors get **bulk approval** (select all, check/uncheck, approve, reject).

D2 Event-based points (e.g. Work Order Received = 100) are **verified by the supervisor** before counting.

D3 All approved slots carry points. Every activity has a **category**, and category-wise task analysis is shown in dashboards.

D4 Activities are designed as **one-slot units of verifiable output** (e.g. “Make 8 cold calls”), so a logged task counts as one slot of effort even if it took longer.

D5 **Every task, including assigned and personal tasks (if the task is allocated for the specific member by the supervisor), carries points** from its Activity Type until an admin sets that type’s points to 0.

D6 **No default daily limit on framework steps.** Unfinished items carry to the next day; an overloaded member is flagged to the supervisor and no further tasks are forwarded until cleared.

D7 **KPIs are derived from pipeline records** (Section 5.5). Odoo has no API sync in MVP.

D8 **Marketing is a Role Profile on the same engine:** members log marketing tasks which was allocated to them by the supervisor and are evaluated by weightage and assigned tasks. Campaign management is deferred.

D9 Leaderboards are configurable (self-vs-target; peers inside the team on the individual dashboard; team leaders see other teams’ summaries; management sees all). AI insights: a member sees their own, a team leader sees the team.

D10	English first; multi-currency selectable in configuration; no hosting or stack constraint (may be offered as a separate product).
D11	Win celebrations (client name, value visibility), pipeline stages, sales process per segment, reminder channels and quiet hours are all configurable.
D12	XP/levels, rewards catalogue and Hall of Fame are removed from scope.
D13	**No default company.** Company name, logo and branding are created at tenant configuration.

1. Purpose, philosophy, scope

1.1 Purpose

Replace the spreadsheet operation system (daily hourly logs, KPI input, configuration, dashboards, performance scoring, weekly lead/opportunity summary) with a web application that any team (sales, marketing, support, delivery) adopts through configuration alone. Beyond monitoring, TOS is a **success framework and playbook**: it tells each member what to do next, guides every deal through a proven process, and keeps the team motivated, so that it becomes a natural part of every working day.

1.2 Principles

1. **Measure hours of output, not hours of presence.** Only planned (or re-approved) slots with a recorded activity count.
2. **Everything becomes a numeric score** via configurable points per role, overridable per person.
3. **Radical transparency.** Members see their live score, target gap and standing.
4. **Plan, commit, execute, review.** Approved plans are binding.
5. **Configuration over code.** A new team launches without a developer.
6. **Explainable scoring.** Every number drills down to source entries.
7. **Playbook first.** Every day starts from one screen that says what to do next.
8. **Coach to win.** Every report also suggests an action. Encourage, never scold.
9. **Simplicity test.** If a feature adds a daily step without helping the member win, cut it.

1.3 Minimum Lovable Product (MLP)

Three things must feel excellent: (1) the **Plan → Log → Score** loop, (2) the **Daily Playbook** as the home screen, (3) the **Pipeline with Stage Frameworks and Client Log**.

1.4 Scope

In scope (v1): configuration engine, planning and approval, timesheet, scoring, KPIs and lightweight pipeline, My Tasks, stage frameworks, Daily Playbook, client log, guided experience, simple recognition, rule-based AI Coach, dashboards, prebuilt reports, import from existing sheets, audit trail. **Out of scope (v1):** full CRM (contacts, quotations, invoicing, email sync), payroll, HR leave management, native mobile apps (responsive PWA only). The data model must not block a later CRM.

1.5 Product readiness

- **Multi-tenant from day one:** organisation-scoped data and configuration.
- **New-organisation setup wizard:** organisation profile and branding → teams → role profiles → activities (from template packs or blank) → frameworks → invite users.
- **White-label:** product name, logo, colours (contrast-validated), email sender name, domain, document headers, currency, number and date formats.
- **Template packs:** Software B2B Sales, Tender Sales, Marketing Lead Generation, Blank. Packs are data, importable and editable.

2. Current state (from the existing sheets)

Area	As-is	Carry-over requirement
Daily log	One tab per member; 10 hourly slots (H-1 to H-10) chosen from a role-specific dropdown; free-text remarks only; hours = filled slots; points = sum of milestone points	Slot-based timesheet, role-specific activity lists, points per slot, remarks the only free text
Task master	~43 milestones in 12 task types; 1 to 10 points per hour; *Client Work Order Receiving* = 100 as a one-off event	Time-based and event-based scoring modes
Config	Per-member weekly hour, monthly points, lead, opportunity, client and revenue targets; per-role weight table (6 metrics = 100%)	Role defaults plus individual overrides; weights validated

Weekly KPI input	Leads (client shows interest), Opportunities (client shares requirements), Clients (work order issued), Revenue (BDT)	Configurable KPI types with stage definitions
Composite score	Weighted sum of actual ÷ target for avg weekly hours, points, leads, opportunities, clients, revenue; can exceed 100%	Configurable formula; default as is
Calendar	Saturday-start week; Friday excluded from weekly hours	Configurable week start and working days
CRM sheets	Row per client, creation week, requirement, then a status note per week	Pipeline record with a Client Log timeline
Dashboard	Weekly hours vs target with On Target / Near / Below, YTD hours, monthly metrics	Live dashboards, configurable thresholds

Weaknesses to remove: hardcoded row ranges, monthly average assuming 4 weeks, short-name mismatches in lookups, duplicated per-person tabs, free-text pipeline notes with no stage, planning tabs without an approval state, no audit trail.

3. Users and roles

Role	Purpose	Key permissions
Member	Does the work (sales, marketing or any other Role Profile)	Own plan, timesheet, tasks, pipeline records, dashboard
Supervisor / Team Leader	Runs a team	Approve plans and deviations, review any entry, edit team targets within limits, assign tasks, build

		frameworks, view team data and other teams' summaries (if enabled)
Management	Oversight	Read all dashboards and reports across teams, export
Admin	Configures the tenant	Organisation, teams, roles, activities, scoring, calendars, users, integrations
Auditor [P2]	Review	Read-only data and audit log

RBAC is data-driven with team-scoped visibility. Acting-supervisor delegation is [P2]. A **platform owner** role (above tenant admins, for running TOS as a product) is [P3].

4. Glossary

- **Organisation → Team → Member.** One primary team per member.
- **Role Profile:** bundle of allowed activities, weights, default targets. One per member plus optional overrides.
- **Activity Type:** recordable item with category, scoring mode (time-based or event-based), points (0 allowed), required fields.
- **Slot:** smallest plannable/loggable unit; default 1 hour, configurable (30/60 min); default 10 per day.
- **Plan / Timesheet entry:** intended vs actual activity per slot.
- **Output hour:** a filled slot that matches an approved plan item or approved deviation (or a counted unplanned slot under D1).
- **KPI Type:** configurable outcome metric bound to a pipeline stage event.
- **Stage Framework:** dated schedule of steps for a client at a pipeline stage.
- **Daily Playbook:** the member's home screen for the day.
- **Client Log:** interaction timeline of a pipeline record.

5. Functional requirements

5.1 Tenant and configuration engine [MVP]

- **FR-C1 Organisation profile and branding:** name, product name, logo, brand colours, time zone, locale, currency, number format (including lakh/crore), date format. Nothing is hardcoded.
- **FR-C2 Teams and calendars:** each team has week start, working days, slots per day, slot length, holidays, lock time.
- **FR-C3 Activity Catalogue:** category, task name, scoring mode, points (0 allowed), required fields (client, quantity, link), active flag, allowed Role Profiles; CSV import/export. Note that all activities are not equal to an hour or half hour of effort. For example, a follow up call may take 5-minutes which may be an activity but not a task to be completed for an hour. An hour of slot may require "Make 8 follow up calls" to be created and allocated to a specific team members. But a client meeting may take 1 hour which could be a task which is equal to the effort of 1 hour. Remember the philosophy, The system will not count hours of work done by a member, it will create task which is the output of an hour and allocate the task to relevant team members. Once the hour slot is filled up, the system will count 1 hour (configurable) of work/effort as a record, even a member may take 3 hours to complete it, or a member may take half hour to complete it, the system will count it as 1 hour of effort.
- **FR-C4 Role Profiles:** allowed activities, default targets, metric weights (must total 100%).
- **FR-C5 Individual overrides** of points, targets, weights, weekly hours with effective-from date; history uses the configuration valid at the time (versioned).
- **FR-C6 KPI Types:** name, unit, definition, **bound stage event** (Section 5.5), target period, weights per Role Profile.
- **FR-C7 Composite formula and thresholds:** library of metric types (hours ratio, points ratio, KPI ratio, adherence, custom expression), optional cap/floor; status thresholds and colours (default On Target ≥ 100%, Near ≥ 80%).
- **FR-C8 Approval policy per team:** approver, SLA, deviation window, unplanned-hours mode (D1).
- **FR-C9 Versioning and audit** of every configuration change.
- **FR-C10 Template packs:** import a pack into a tenant as editable data.

5.2 Planning and approval [MVP]

Rules in Section 6.

- **FR-P1** A member plans a full day or any slots (e.g. H-1 to H-4), choosing an Activity Type per slot or range, optionally linking a pipeline record or task.
- **FR-P2** States: Draft → Submitted → Approved / Rejected (with comment) / Partially approved → In execution → Closed. The supervisor approves all, part, or edits and approves.
- **FR-P3** Approved slots are binding.
- **FR-P4** Weekly grid with copy-forward and reusable templates.
- **FR-P5** Supervisor planning board: members × slots, pending approvals highlighted, coverage by category, **bulk approve**.

- **FR-P6** Submission cut-off configurable (default previous working day); same-day planning per policy.

5.3 Timesheet [MVP]

- **FR-T1** The member logs each slot: Done / Partly / Not done, activity, quantity, output reference, remarks. **Activities are chosen only from a searchable dropdown** of the activities the supervisor assigned to that member's role. Only the daily remarks field is free text.
- **FR-T2 Deviation:** a different activity in a planned slot needs a reason, is *Pending deviation* and counts zero until the supervisor approves (retroactive on approval).
- **FR-T3 Unplanned slots** count provisionally by default (D1); the supervisor may edit, delete or flag them any time.
- **FR-T4** Entries editable until the daily lock; later changes need a supervisor-approved correction.
- **FR-T5** Event-based activities (e.g. work order) are logged as events with evidence and are verified (D2).
- **FR-T6** Daily summary: planned hours, logged hours, output hours, points, adherence %.
- **FR-T7** Planned slots are pre-filled from the approved plan so the member only confirms.

5.4 Scoring engine [MVP]

Rules in Section 7.

- **FR-S1** Every counted slot or event writes a **score ledger** entry (member, date, activity, points, config version, source). Scores derive from the ledger, never typed.
- **FR-S2** Live recalculation within 5 s.
- **FR-S3** Drill-down from any number to ledger entries.
- **FR-S4** Composite score per member, team and period using the configured formula; config changes create a new version effective from the current month.
- **FR-S5** Leaderboard modes per team: off; self-vs-target; improvement vs own last period; team vs team. Peer ranking inside the team shows top N plus the viewer's own position (no public bottom list). Leaders see other teams' summaries if enabled; management sees all.
- **FR-S6 Category analysis:** hours and points by activity category per member, team and period.

5.5 KPIs and lightweight pipeline [MVP]

Why records are needed: without a client record there is no evidence for a lead or opportunity count. TOS therefore keeps the *minimum* record per qualified lead or opportunity, and **derives KPI numbers from it**, so members never type counters.

- **FR-K1 Minimal pipeline record:** client/organisation, requirement, stage are required (quick add in about 15 seconds). Optional: segment/product, owner (default creator),

expected value (required from the Proposal stage), lead source, tender deadline, Odoo ID or link.

- **FR-K2 KPI derivation:** each KPI Type is bound to a stage event. Default: *Qualified Lead* = record reaches stage Qualified Lead; *Opportunity* = reaches Requirements Shared; *Client* = Won with a verified work order event; *Revenue* = verified won value. A record counts once per KPI per owner; a stage moved backwards is flagged for review. Counts are computed per period from stage-change events; the team leader may review and adjust (audit-logged).
- **FR-K3** The weekly KPI sheet becomes an auto-computed summary that the member confirms in the Weekly Review (one tap).
- **FR-K4 Marketing:** marketing members create lead records (stage and source) and are scored on their own KPI Types and weights; handoff to sales is [P2].
- **FR-K5 Manual count mode** (team setting, default off): weekly counts typed in, labelled *unevidenced*. Not recommended.
- **FR-K6 Odoo bridge:** until an API exists, TOS is master for the lightweight pipeline and Odoo for customer records. MVP: CSV/Excel import of an Odoo opportunity export with stage mapping, plus an Odoo ID/link field. [P2]: API sync with external-ID mapping.
- **FR-K7** Lost reasons from a configurable list.
- **FR-K8** Revenue in the tenant currency with an optional currency field per record.
- **FR-K9 Sales process:** stages are configurable, with exit criteria, expected days and default probability, per segment or product (for example Tender, Corporate, SaaS).
- **FR-K10 Deal health:** per record, a simple indicator (days in stage vs expected, last contact, overdue step) with a suggested fix.
- **FR-K11 Win/loss note:** on Won or Lost, three fields (why, competitor, lesson).

5.6 My Tasks [MVP]

A personal to-do list with calendar dates. Titles are free text.

- **FR-MT1 Quick add** from the global “+”: title, due date (default today), optional time, priority, optional client link, **Activity Type** (defaults to the team’s general-task type). Natural dates (“tomorrow”, “Sun”) parsed by rules.
- **FR-MT2** Views: Today, Upcoming (calendar and list), Overdue, Done; drag to reschedule.
- **FR-MT3** Status Open, Done, Dropped (optional reason); repeat none/daily/weekly.
- **FR-MT4 Assigned tasks:** supervisors assign tasks with due date and Activity Type; they appear tagged *Assigned by* and are **pre-approved** for scoring. Their completion is visible to the supervisor.
- **FR-MT5 Scoring (D5):** every task carries the points of its Activity Type until an admin sets them to 0. Completing a task opens a **pre-filled timesheet entry** for a free slot (task’s Activity Type, member confirms the slot). It follows the normal rules: assigned = pre-approved; self-created and unplanned = provisional (D1); planned in advance = approved. A task never scores beyond the day’s slot capacity, so self-created tasks cannot inflate hours.

- **FR-MT6 Privacy:** personal task titles are private; supervisors see counts and assigned tasks only (configurable).
- **FR-MT7** Due-today tasks appear in the Playbook; optional reminder under the daily notification cap.

5.7 Stage Frameworks [MVP]

A **framework** is a reusable schedule of steps for a client at a pipeline stage (for example *Qualified Lead: 14-day follow-up*). When a record enters the stage, dated steps are generated and appear in the member's Playbook.

- **FR-SF1 Framework Studio** (supervisor, admin): name, description, target stage, optional segment/product filter, active flag, version.
- **FR-SF2 Steps:** title, **day offset from stage entry (working days)**, type (Call, Email, WhatsApp, Visit, Demo, Proposal task, Internal prep, Custom), optional linked **Activity Type** (so the step can be planned in a slot and earn points), optional template/resource link, instruction text, stop conditions. Note that all steps are not equal to an hour or half hour of effort. For example, a follow up call may take 5-minutes which may be an activity but not a task to be completed for an hour. An hour of slot may require "Make 8 follow up calls" to be created and allocated to a specific team members. But a client meeting may take 1 hour which could be a task which is equal to the effort of 1 hour. Remember the philosophy, The system will not count hours of work done by a member, it will create task which is the output of an hour and allocate the task to relevant team members. Once the hour slot is filled up, the system will count 1 hour (configurable) of work/effort as a record, even a member may take 3 hours to complete it, or a member may take half hour to complete it, the system will count it as 1 hour of effort.
- **FR-SF3 Outcome rules:** completing a step asks for an outcome (Connected, No answer, Call later, Not interested…). Per framework an outcome may *retry in N days (max M times)*, *jump to a step*, or *flag the record for stage review*.
- **FR-SF4 Multiple frameworks per stage; one default** assigned by the supervisor (optionally per segment/product). A member may pick another approved framework on one record.
- **FR-SF5 Auto-generation:** entering a stage creates dated steps on the team calendar (weekends and holidays skipped). On stage change, unfinished steps of the old framework are closed after asking *keep or drop*.
- **FR-SF6 Load handling (D6):** there is **no default limit** on steps per day. Unfinished steps carry over. A member is flagged **Overloaded** when open overdue items exceed a threshold (default 10) or the oldest overdue item is older than 5 working days. Then the supervisor sees a *Member overloaded* note, new framework steps for that member are **held in a waiting queue** instead of being forwarded, and new lead auto-assignment skips them. The flag clears automatically when the member is back under the threshold; the supervisor may override. Thresholds are configurable.
- **FR-SF7 Versioning:** edits affect **new records only** by default; *apply to open records* shows a preview of changed dates.

- **FR-SF8** Completing a step writes the Client Log automatically.
- **FR-SF9 Effectiveness** [P2]: stage conversion, days in stage and step completion per framework, to support choosing the best one. The system recommends; the supervisor decides.
- **FR-SF10** Frameworks ship only as part of template packs (Section 12.1), editable by the supervisor.

5.8 Daily Playbook [MVP] — the home screen

The single entry point of the day. It replaces separate Next Step, Daily Rhythm and reminder surfaces. One highlighted **Start my day** button opens it; each item opens the exact screen with fields pre-filled.

Priority	Source	Examples
P0 Fix now	System blockers	Rejected plan or deviation, new lead awaiting first contact, approval or KPI overdue
P1 Planned	Approved plan slots as time-blocks	“H-3 Cold Calling ×8” with Done / Partly / Not done
P2 Framework	Steps due today	“Day 5: proposal follow-up call”
P3 My Tasks	Personal and assigned tasks due today	“Prepare brochure for Sunday visit”
P4 Carry-over	Unfinished earlier items	After 3 days: Reschedule, Drop or Add to plan
P5 Suggested	AI Coach picks, max 3	“Opportunity untouched for 14 days: call today?”

P6 Assistant	Important reminders	Tender deadline in 2 days, weekly KPI due, meeting today, approval pending

- **FR-DP1 Three phases:** *Morning* (review, fix P0), *Execute*, *Close the day*. One primary action visible at any time.
- **FR-DP2 Do-now cap:** at most 7 items in *Do now* (configurable), the rest under *Up next*, so the list never looks impossible.
- **FR-DP3 Close-the-day checklist (auto-ticking):** timesheet complete, Client Log updated for clients touched, missed slots explained, tomorrow's plan submitted, optional day note. Ticks come from system data.
- **FR-DP4 Day progress ring:** weighted completion (P0 = 3, planned slot = 2, framework step = 2, task = 1, closing item = 1; suggestions and reminders excluded), positive wording, never a red failure state. **It never changes the composite score.**
- **FR-DP5 Notes and quick add:** a day note and quick add for task or note; a note can attach to a client and appears in the Client Log.
- **FR-DP6 Refresh and history:** generated on first open of the day (or 00:05 team time), live thereafter; a snapshot is kept for trends.
- **FR-DP7 Carry-over:** unfinished P1 to P3 items roll over marked *Carried*; framework steps never vanish silently, drops are logged.
- **FR-DP8 Light days:** with few items, suggest the best use of free slots from the target gap.
- **FR-DP9 Supervisor lens:** approvals due, members with unclosed days, overloaded members, stuck deals, recognition prompts. Team view shows completion %, not private task contents.
- **FR-DP10** Daily playbook will showcase a small stopwatch containing the number of hours and minutes has passed since the daily playbook opened, and will continue untill day close button clicked by the member. If not clicked it will stop by default at the end of the day.
- **FR-DP11** Sources, weights, caps, closing items, phase labels and message tone are configurable.
- **FR-DP12** [P2] Morning Playbook by WhatsApp or email.

5.9 Client Log and Weekly Review [MVP]

- **FR-CL1 Client Log:** timeline per pipeline record (Call, Email, WhatsApp, Visit, Meeting, Note); quick form of at most 3 fields (type, outcome, note); next date pre-filled from the framework.
- **FR-CL2 Weekly status is auto-compiled** from the week's log entries; the member reviews and confirms in one tap.
- **FR-CL3 Mandatory next step:** an open record always has a next framework step or a dated next action; saving without one is blocked.

- **FR-WR1 Weekly Review** (10 minutes, last working day): confirm derived KPI counts and deal statuses, see the recap, pick one focus, submit next week's plan.
- **FR-WR2** The supervisor runs a 15-minute team review from the same data.

5.10 Guided experience [MVP]

- **FR-G1 Onboarding** (5 steps, ≤ 10 minutes): role in plain words, this week's targets, first plan from a template, a practice slot (not scored), finish on Home. Resumable; supervisor sees completion.
- **FR-G2 Plain-language gaps:** each metric has a one-line meaning and an action ("You need 6 more output hours this week, about 1 per working day. Plan cold-calling slots").
- **FR-G3 Teaching empty states** with one button;
- **FR-G4 contextual help** on every field, short replayable tours, help text editable per tenant.
- **FR-G5 Member menu:** *Home, My Day, My Tasks, My Pipeline, My Progress.* Admin screens are hidden by role.
- **FR-G6 Smart defaults:** plan templates from role and last week; slots pre-filled; client names autocomplete from the pipeline.
- **FR-G7 First 30 days:** week 1 *learning mode* (scores visible, excluded from rankings), optional Day-30 review generated from data.

5.11 Recognition [MVP, simple]

Never changes the composite score; each item can be switched off per team.

- **FR-MO1 Progress rings** (day, week, month) and a positive forecast ("Two more qualified leads gets you to 100%").
- **FR-MO2 Streaks:** days closed on time, weeks on target; leave and holidays never break a streak.
- **FR-MO3 Five fixed badges** (e.g. First Work Order, 4-Week On-Target Streak, Comeback). Admin-defined badges [P2].
- **FR-MO4 Celebration** of a verified win: in-app animation, feed post, supervisor message; client name and value shown per policy (D11).
- **FR-MO5 Win feed** with reactions; management sees cross-team wins.
- **FR-MO6 Supervisor prompts** ("Send kudos for a first on-target week?"; members with no recognition in 30 days).
- **FR-MO7 Weekly personal recap** (wins, best day, what improved, one focus). Kudos, team challenges and extra leaderboard modes are [P2].

5.12 AI Coach [MVP rules-based; P2 LLM]

Advisory only; it never changes scores, approvals or targets. **MVP uses deterministic rules and calculations; an LLM later only writes wording and answers questions.** The product works fully with AI switched off.

- **FR-AC1 Daily suggestions:** up to 3 per member in the Playbook, ranked by target gap × the member's own conversion rate; each shows **why** (evidence link), a one-tap action and *Useful / Not useful*.
- **FR-AC2 Target vs achievement:** pace for hours, points and each KPI, projected month-end with a range, the biggest gap in plain words, catch-up plan (target-to-activity calculator: "BDT 50 lakh ≈ 4 clients ← 10 opportunities ← 25 leads ← ~150 calls", using the member's own conversion rates).
- **FR-AC3 Task analysis:** category mix vs the role's expected mix, plan vs actual, deviation rate, points per output hour, activity-to-outcome conversion, quality flags (vague remarks, copied entries, spikes). Flags never reduce points automatically.
- **FR-AC4 Client next step:** next best action from the framework, last contact, days in stage, similar past wins and losses.
- **FR-AC5 Weekly pack:** member recap and a one-page team summary. **FR-AC6 Supervisor morning brief:** 3 to 5 lines per member and "Your 3 actions today", each linked to source entries.
- **FR-AC7 Ask** [P2]: plain-language questions with a linked table.
- **FR-AC8 Guardrails:** evidence for every insight, AI label, feedback buttons, outputs logged, no protected attributes, members see their own insights and leaders see their team (D9), minimal data sent to any LLM, per-team cost cap and global off switch.

5.13 Dashboards [MVP]

- **FR-D1 Member:** Playbook entry, today's plan, week hours and points vs target, composite score, per-metric gap, standing, category mix, pipeline due.
- **FR-D2 Supervisor:** approvals queue, plan coverage, planned vs actual, member scorecards with status colours, at-risk and overloaded members, stale pipeline, team funnel, category analysis.
- **FR-D3 Management:** cross-team comparison, trends, funnel by team and segment, revenue vs target, hours vs outcome, top deviations, AI insight panel.
- **FR-D4** Filters (team, person, period, role profile) and saved views. **FR-D5** Freshness indicator; usable on tablet and phone.

5.14 Reports [MVP basic; P2 builder]

- **FR-R1** Prebuilt: weekly/monthly performance, task analysis by category and task, KPI summary, plan adherence, approval turnaround.
- **FR-R2** [P2] Report builder (dataset, dimensions, measures, filters, chart; save, schedule, share). **FR-R3** Export CSV/XLSX/PDF matching on-screen numbers.

5.15 Notifications, quick capture, audit [MVP]

- **FR-N1** In-app notifications (email/WhatsApp [P2]) for plan submitted/decided, deviation pending, missing log at lock, SLA breach, KPI confirmation due. Member-chosen

channels and quiet hours; digest mode and a daily cap. The Playbook is the main channel.
- **FR-N2** Immutable audit log of plans, approvals, edits after lock, configuration changes, recalculations, KPI adjustments, exports.
- **FR-Q1 Mobile quick log** in 3 taps or less (installable PWA, offline capture and sync). **FR-Q2 Global "+":** Log slot, Task, Note, Lead, Win.

5.16 Data migration [MVP]

- **FR-M1** Import the existing workbook: configuration (targets, weights, task master → Activity Catalogue), daily logs (→ timesheet and ledger), weekly KPI input, CRM sheets (→ pipeline records and Client Log). Dry run with a validation report (unknown tasks, name mismatches). Used through the Seed Pack route (Section 12.1).

6. Planning and approval rules

- **State model:** Draft → Submitted → Approved | Rejected | Partially approved → In execution → Closed. Rejected slots return to Draft.
- **Binding rule:** at the daily lock every approved slot has an entry or *Not done* with a reason. Unfilled approved slots count zero and raise a *missed commitment* flag that lowers adherence.
- **Deviation rule:** (1) different activity in a planned slot with a mandatory reason; (2) state *Pending deviation*, points and hours zero; (3) the supervisor approves, rejects, or approves at another activity/value; approved counts retroactively, rejected stays zero and the planned activity is marked not done; (4) pending deviations older than the window (default 48 h) escalate to the next approver; auto-approve is off by default; (5) deviation rate is tracked per member.
- **Unplanned slots:** counted provisionally (D1); the supervisor can edit, delete or flag at any time; flagged entries lose their points and are audit-logged.
- **Other rules:** overlap, double booking and slots outside working hours are rejected; supervisor-assigned tasks insert as pre-approved; leave/holiday/training slots are *Excluded* (targets prorated); approvers cannot approve their own plan.

7. Scoring specification

- **Time-based points:** counted slot × activity points (individual override, then Role Profile, then catalogue default). **Event-based points:** quantity × event points once verified.
- **Output hours** = counted slots × slot length. **Adherence %** = completed approved slots ÷ approved slots. **Efficiency** = points per output hour.
- **Achievement** = actual ÷ target for the period, with targets prorated for part periods, leave and joining date (replaces the "÷ 4 weeks" assumption).

- **Composite score** = Σ (weight × achievement). Default metrics: average weekly output hours, points, qualified leads, opportunities, clients, revenue. Weights are per Role Profile with member overrides; 0% weight metrics are shown but not scored.
- All formulas run on the ledger with the configuration version pinned; history changes only through an explicit, audit-logged recalculation.
- **Out of the score:** Playbook progress, streaks, badges and recognition never enter the composite.

8. Data model (logical)

Organisation, Branding, Team, User, Membership, RoleProfile, Permission, CalendarConfig, Holiday, ActivityCategory, ActivityType, ActivityAssignment, MemberOverride, KpiType, KpiTarget, ScoringModel(version), ScoreWeight, TemplatePack, Plan, PlanItem, ApprovalRequest, TimesheetEntry, EventLog, ScoreLedger, PipelineRecord, PipelineStage, StageEvent, KpiSnapshot, LostReason, PersonalTask, TaskAssignment, Framework, FrameworkVersion, FrameworkStep, FrameworkAssignment, StepInstance, OutcomeRule, ClientLogEntry, WeeklyReview, PlaybookDay, PlaybookItem, DayNote, OverloadFlag, Badge, BadgeAward, Streak, FeedPost, AiSuggestion, Notification, ReminderPreference, AuditLog, ReportDefinition, ImportJob, AdoptionMetric.

Rules: every table carries organisation_id and team_id, created/updated by and at, soft delete; configuration tables carry effective_from/to and version; PipelineRecord is extensible toward Contact, Account, Quote and Activity entities; Playbook items reference their source by type and ID.

9. Non-functional requirements

- **NFR-1 Usability:** an untrained member finishes onboarding and submits a first plan in ≤ 10 minutes; ≥ 90% can say what to do next within 5 seconds of opening Home; one primary action per screen; most frequent actions in ≤ 3 taps; target SUS ≥ 80.
- **NFR-2 Performance:** dashboards ≤ 2 s for 50 members × 1 year; recalculation ≤ 5 s. **NFR-3 Scalability:** multi-tenant, 20 teams / 500 users per tenant without redesign, stateless services.
- **NFR-4 Security:** SSO-ready (Google, Microsoft), RBAC, row-level tenant and team scoping, encryption at rest and in transit, session timeout, full audit.
- **NFR-5 Privacy and fairness:** members see all data held about them; AI insights are explainable and contestable; configurable retention; tenant data never mixed.
- **NFR-6 Reliability:** daily backups, point-in-time restore, 99.5% uptime. **NFR-7 Integrability:** documented REST API and webhooks, CSV import/export.
- **NFR-8 Maintainability:** typed codebase, automated tests for scoring, approval, KPI derivation and framework scheduling, migration scripts.

- **NFR-9 Lightweight:** one-container deploy for v1. **NFR-10 Healthy motivation:** all recognition features switchable; no public low-performer lists; [P2] 2-question monthly pulse.
- **NFR-11 Accessibility and language:** WCAG 2.1 AA; English first, Bangla-ready (Section 10.2).

10. UI/UX guideline (binding for Phase 0 and later)

10.1 Principles

Calm and clear; Playbook first; do not configure in member screens; progressive disclosure (3 key fields, rest under *More*); pre-fill and confirm; encourage, never scold; fast (log a slot in ≤ 3 taps, close a day in ≤ 2 minutes, optimistic UI, undo toast instead of confirm dialogs).

10.2 Typography

- **Inter** (variable) for Latin text and numbers, **Noto Sans Bengali** as Bangla fallback (Inter has no Bangla glyphs), system-ui last. Tabular numerals for all figures.
- Scale (px/line): 12/16 caption, 13/18 small, 14/20 body, 16/24 large body, 20/28 section, 24/32 page, 32/40 hero metric. Weights 400 / 500 / 600. At most three sizes per screen.
- Numbers and dates follow tenant format (e.g. lakh/crore grouping 5,00,000; 07 Nov 2026).

10.3 Colour tokens

Calm, low-glare neutrals with one accent. *primary* and *accent* are **tenant brand colours** (defaults below); the system checks contrast (4.5:1 text, 3:1 UI) and derives the dark theme.

Token	Light	Dark	Use
`bg`	#F6F8FA	#0F1720	App background
`surface`	#FFFFFF	#17212B	Cards, panels

`border`	#E3E8EE	#26323E	Dividers
`text`	#1F2933	#E6EBF0	Primary text
`muted`	#64748B	#94A3B8	Secondary text
`primary`	#3A6EA5	#6FA3D8	Primary action, links, focus
`accent`	#2A9D8F	#4CC3B4	Progress, positive highlight
`success`	#2E7D5B	#5BBE90	On target, done
`warning`	#B7791F	#E0A94A	Near target, due soon
`danger`	#B84A4A	#E08A8A	Overdue, rejected (sparingly)

Status is never shown by colour alone: pair with icon and label (On Target, Near, Below).

10.4 Layout, components, behaviour

- **Grid:** 8 px scale; content max 1200 px; Playbook column max 720 px; cards radius 12 px, one soft shadow, 1 px border.

- **Navigation:** left rail (desktop) or bottom tabs (phone) with the five member items; top bar with search, **"+" quick add**, notifications, profile; supervisor and admin items only for those roles; tenant logo and name in the header.
- **Key components:** Playbook item card (checkbox + one action), day ring, slot chip grid (H-1…H-10), stage stepper, Client Log timeline, metric tile (value, target, gap sentence), table with sticky header, saved views and bulk select, side drawer, command palette (`/`).
- **Motion:** 150 to 200 ms ease-out; celebration only for verified wins; honour reduced-motion. **Charts:** one calm palette, direct labels, no 3D, colour-blind safe, table alternative.
- **States:** every screen defines loading (skeleton), empty (what, why, one button), error (plain words, retry), offline (queued with sync badge).
- **Forms:** one column, labels above, inline validation, autosave, keyboard flow (`L` log slot, `N` new task). **Density:** comfortable for members, compact for supervisor tables.
- **Responsive:** 360 px phone (primary for quick log), 768 tablet, 1280 desktop; touch targets ≥ 44 px. **Voice:** short, warm, plain, no blame.

10.5 Phase 0 screens (clickable prototype, mock data)

Screen	Role	Primary action
Organisation setup and onboarding	Admin / Member	Finish and open Home
Home: Daily Playbook	Member	Do the next item
My Day (plan grid, slot log)	Member	Confirm Done
My Tasks	Member	Add task
My Pipeline and Record detail (stage stepper, framework steps, Client Log)	Member	Complete next step
My Progress (rings, gaps, AI Coach, weekly recap)	Member	Open suggested action

Team Board (approval grid, bulk approve)	Supervisor	Approve selected
Team Dashboard and Member detail	Supervisor	Open a member’s day
Framework Studio	Supervisor	Assign default framework
Management Dashboard	Management	Drill into a team
Admin: Organisation and branding, Teams, Activities, Role profiles, Scoring, Calendar	Admin	Save

Prototype test: 5 real members, 5 tasks each. Pass if 4 of 5 name the next action within 5 seconds of opening Home, log a slot in 3 taps, and close a day in under 2 minutes.

11. Architecture, phasing, acceptance, adoption

Suggested stack (OQ-9): React/TypeScript UI; Python (FastAPI) or Node (NestJS) API; PostgreSQL; background worker for recalculation, framework scheduling and AI jobs; LLM behind an abstraction layer.

Integration principle: TOS owns plans, timesheets, scores and the lightweight pipeline; Odoo (or any CRM) owns customer records until Phase 3, through an adapter and external-ID mapping.

Phase	Content	Exit criteria
0 UI prototype	Screens in 10.5 on mock data	Owner sign-off and the prototype test

1 MLP	Sections 5.1 to 5.16 marked [MVP]	The first team runs 4 consecutive weeks without spreadsheets
2 Integrate and extend	Odoo API sync, email/WhatsApp, report builder, LLM coach, framework effectiveness, lead handoff, kudos and challenges, second team by configuration only	A non-sales team live with zero code change
3 Full CRM / backlog	Section 12.2	Management decision

11.1 MVP acceptance criteria

1. An admin creates a new organisation with branding, a team, activities, points, weights and targets without developer help, and no default company text appears anywhere.
2. A member submits a half-day plan; the supervisor approves; the member logs; points appear within 5 s.
3. A deviation counts zero until approved, then counts retroactively; the audit log shows the trail. Unplanned slots count provisionally and the supervisor can flag them.
4. Changing a points value does not alter last month's score unless a recalculation is run.
5. Imported 2026 data reproduces the sheet's weekly hours, monthly points and composite score within 1%, with variances explained.
6. Every dashboard number drills down to ledger entries.
7. Moving a pipeline record to the Opportunity stage increments the Opportunity KPI within 5 s without any counter being typed; the weekly KPI view matches.
8. A supervisor builds a 6-step framework, makes it the stage default, and a record entering the stage gets dated steps on correct working days within 5 s.
9. Home shows a Playbook combining planned slots, framework steps, tasks, carried items and at most 3 suggestions; the ring updates as items complete; closing items auto-tick.
10. Completing a step with an outcome writes a Client Log entry and applies the outcome rule.
11. A member with open overdue items above the threshold is flagged *Overloaded*; new steps are held, the supervisor is notified, and the flag clears when the backlog falls.
12. Completing a task with a scored Activity Type creates a pre-filled timesheet entry and scores per D5; a type set to 0 points scores nothing; a day never exceeds its slot capacity.
13. Every AI suggestion shows evidence and can be dismissed; with AI off the Playbook still works. Recognition never changes the composite score.

11.2 Adoption metrics (the system must prove it is a habit)

Track from week 1: days closed by the lock time (≥ 90%), Playbook opened before the first slot (≥ 85%), median time to close a day (≤ 2 min), slots logged within 2 hours of slot end (≥ 80%), framework steps done on their due date (≥ 70%), and a monthly pulse (*Is TOS helping you win? Is it fair?*). If these slip, simplify the UI before adding features.

12. Seed Pack and backlog

12.1 Seed Pack: Software B2B Sales (loaded only into a tenant that asks for it)

Built from the original sheets so the first team starts with real configuration.

- **Calendar:** Saturday-start week, Friday off, 10 slots of 1 hour.
- **Activities:** about 43 milestones in categories Lead Generation, Cold Client Calling, Cold Client Emailing, Cold Client Visit, Client Meeting, Proposal Preparation, Sales, Planning & Reporting, Office Meeting, Commercial, Product Management, Special Assignment; 1 to 10 points per hour; Work Order Receiving = 100 (event-based, verified).
- **Role Profiles and default weights (%):**

Metric	National Sales (Tender)	International Sales (Product)	International Sales (AI)	Marketing
Avg weekly output hours	20	20	20	20
Points	5	5	5	10
Qualified leads	15	10	20	70
Opportunities	10	15	15	0
Clients	10	10	10	0

Revenue	40	40	30	0

- **Sales process (default):** Lead → Qualified Lead → Requirements Shared → Solution/Demo → Proposal/Tender Submitted → Negotiation → Won / Lost, with one starter framework per stage (follow-up calls, emails, visits, proposal follow-up, lost-deal nurture).
- **Data:** targets, daily logs, weekly KPIs and CRM sheet history through FR-M1.

12.2 Backlog (not in v1)

Item	Phase	Note
Odoo API sync	P2	Replaces the CSV bridge
Lead handoff with SLA, campaigns, lead scoring, attribution	P2	Marketing tools beyond task logging (D8)
Kudos, team challenges, admin-built badges, extra leaderboard modes	P2	Switchable
Coaching: 1:1 agenda, skill matrix, micro-learning	P2	
LLM-based Ask, natural-language and voice logging, calendar sync	P2	
Tender alert feed and tender tracker	V2	High fit for tender sales teams
AMC and renewal tracker	V2	Recovers renewal revenue

WhatsApp logging bot	V2	Official Business Platform, confirm before saving
Office TV mode, morning huddle screen, weekly management digest	V2	Low effort
Proof of work: call log sync, GPS check-in, card scanner, email capture	V2	Opt-in, privacy review required
Key account plan, relationship map, battlecards, forecast categories	V2	
Automation builder (When, If, Then)	V2	Much is covered by frameworks
Quotation builder, incentive calculator	Not recommended	Overlaps Odoo and payroll; sensitive
Full CRM	P3	If management approves

13. Risks and open questions

Risks: points will be gamed (mitigate with outcome KPIs in the composite, deviation rate, task slot capacity, supervisor review of point values); a low hours metric after migration (hours target must be defined as *output hours*; activities are one-slot units per D4); notification overload (Playbook as the main channel, digest, daily cap); admin power leaking into member screens; double entry with Odoo (minimal record, CSV bridge, later API).

#	Open question	Default used

OQ-9	Stack and hosting	Suggested stack in Section 11; no constraint
OQ-10	**Ownership and licence:** the specification and first deployment use employer data and time. Who owns the code, specification, Seed Pack and any resulting product?	Not decided here. Settle ownership or licence terms with the employer in writing before the build starts, especially if the product is to be offered separately
OQ-11	Product name, logo, domain	Working name TOS; tenant branding is configurable
OQ-12	Odoo export format for the CSV bridge	A standard Odoo opportunity export with stage mapping screen
OQ-13	Overload threshold	10 open overdue items or oldest overdue older than 5 working days; configurable
OQ-14	Reminder channels and quiet hours	No restriction; member-chosen
OQ-15	Playbook timing	Asia/Dhaka as the first tenant’s time zone; lock at working-day end plus 2 hours; configurable
